NORDYC

Shaping programmes for the Future

Shaping university programmes that prepare students for the future

THE PROBLEM

AI is reshaping jobs faster than universities can review their courses

The question for academic teams:

“Are we teaching students what they’ll need when they graduate?”

39%

of workers’ core skills to change by 2030, driven partly by technological advancements and AI

35%

of Malaysian tertiary graduates experienced skill-related underemployment in 2025

WHY IT'S HARD TODAY

Knowing which courses to update is the hard part

Evidence is scattered

Job data, skills frameworks, accreditation standards and AI research all live in different places.

A title isn't the content

A course name alone cannot show what students learn, how they practise or what assessments measure.

Changes need justification

Academic teams need evidence to decide what to update, what to investigate and what should stay.

Reviews University Curriculums, with evidence

Using real-world academic, job-market and AI evidence to help universities shape learning pathways that prepare students for a changing world of work

HOW IT WORKS

From PDF to insight in four steps

01

Upload

Upload a curriculum, brochure or syllabus, then review the extracted course information. Detailed syllabi support a deeper review.

02

Explore

Explore relevant job-market trends, occupational requirements and AI developments, with evidence sources and dates.

03

Align

Compare available course information with academic standards and occupational skills to identify review priorities, potential gaps and missing evidence.

04

Plan

Review proposed curriculum improvements and learning pathways in an Academic Action Plan. Academic teams make the final decisions.

WHAT REVIEWERS GET

Six answers in one workspace

Course Intelligence

Review each course from available evidence

Industry Outlook

Explore dated workforce trends and AI developments in an Industry

Career alignment

The careers a programme leads to, and the skills those careers need.

Academic Recommendations

Proposed improvements and learning pathways, compared with alternatives.

Future Scenarios

How AI adoption assumptions affect proposed interventions.

Academic Action Plan

One plan with evidence, SDG links and human review status.

PROOF

Already built, already tested

25

Documented university programmes

141

Course listings across 3 pilot programmes

247

Malaysian workforce data points

186

Official UN SDG references

38

Occupational reference records

1,177

Automated test cases across backend, frontend and browser
